It will give developers the ability to write less code by using only Swift for both frontend and backend infrastructures.

### **Who created Perfect?**

Perfect was developed by a Canadian startup called PerfectlySoft Inc. The company is headquartered in Newmarket, Ontario, just north of the City of Toronto. PerfectlySoft is a specialty boutique dedicated to providing iOS, OS X, Apple TV and Apple Watch developers with high-performance and secure tools and support to complete their projects efficiently and securely using only the Swift programming language.

### **Is Perfect suitable for enterprise environments?**

Yes. Perfect is the ideal solution for app development for businesses of all sizes and in all industries. It is a secure, high speed, enterprise-grade toolset. It can be used to develop mobile apps, web apps, games, and wearables.

Yes. As a backend development toolset, Perfect is fully compatible with devices running iOS, OS X, Android, Linux, BlackBerry, and Windows.

### **How is Perfect different from other programming languages?**

Perfect utilizes one single programming language called Swift, so it removes the need for programmers to code in multiple languages for both client-side and server-side infrastructures.

This all-in-one, flexible functionality will save them a significant amount of time and money.

### **How popular is the Swift programming language with the global developer community?**

According to respondents of StackOverflow's "2015 Developer Survey", Swift is the "most loved" programming language.

### **How can developers get their hands on Perfect?**

Following the official release on November 24, Interested Swift programmers should join the Perfect community on GitHub to download coding samples and check out the Perfect website. They can also ask questions and get answers on StackOverflow, follow PerfectlySoft on Twitter, and join in the discussion with PerfectlySoft on Google Groups.

### **How will Perfect evolve now that Swift has officially become an open source language?**

Now that Apple has officially declared Swift to be an open source programming language, we will focus on improving the database connectivity tools, and we will add deployment options such as Amazon Web Services images.
